Suitable for UV curing coating, printing ink, UV curing adhesive, optical fiber coating, photoresist, photopolymer printing plate, stereoscopic flat plate resin, composite material, tooth filling material, etc. After illumination, benzoyl and phosphoryl radicals can be generated, which can trigger polymerization and accelerate the speed of photobleaching, which can meet the requirements of deep curing of thick film and constant yellow coating. Because of low volatilization, no residue, especially suitable for requiring low odor products and transparent coating</p> |
